

W1 Individual Reflection DAT256

Stefan Chan

March 2019

1 What do I want to learn or understand better

I personally want to learn and understand more on how to use API's and the process of integrating API's into applications. This also goes for frameworks, in that I want more experience in using different frameworks depending on the specifications and requirements of the application. Being proficient in both of these is what I consider to be a valuable skill to have in this course and potentially later courses. SCRUM is also something I want to have a good understanding of, in order to better understand what the course entails.

2 How can I help someone else, or the entire team, to learn something new

It depends if what I know and can is helpful or useful to others in the group regarding the project. I can help with issues that are associated with programming, but I would be out of my depth if it came to the more business-side of the project.

One method that I believe would allow me to help others later in the course would be through pair-programming. By guiding someone through on how to do something and explaining on how things work, it would provide a good opportunity for the other person to learn. Similarly, helping others can also be done in this manner.

3 What is my contribution towards the team's use of Scrum?

Beyond participating in discussions about how to approach the problems and tasks presented, as well as being active in the Lego exercise, I would say that I haven't contributed anything noteworthy towards the use of Scrum. I do expect this to change in the coming weeks.

4 What is my contribution towards the team's deliveries

I have attended team meetings and helped brainstorming ideas, also integrated travis to our git repository. I've also helped a little when coming up with the social contract.
